

# COURSE 10888 Energy Conservation

**Exam Material** 

## **Uscontractorlicense LLC**

# **Summary Of This Course**

## **Energy Conservation**

Approved by the
Wisconsin Department of Safety and Professional Services Safety and Buildings Division
Course Identification Number 10888
Educational Credit Hours: 6

Course Provider:
USCONTRACTORLICENSE LLC
P.O. Box 268
Platteville, WI 53818
(608) 348-6688

www.uscontractorlicense.com

This course is designed to familiarize Contractors and Inspectors with information on the updated construction codes required for building a home, according to the Uniform Dwelling Code (UDC). SPS 322 and the commentary are used as reference materials.

Covered in this course include Scope, Application, Definitions, Insulation Materials and Installation, Dwelling Thermal Envelope, Systems and Simulated Performance Alternative are included.

This Course is approved for the following Registrations/Certifications or Licenses:

Dwelling Contractor Qualifier	6 Hours of Continuing Education	
UDC - Construction Inspector	6 Hours of Continuing Education	

#### **Course Outline**

This course is a distance learning or e-learning course, which allows the attendee to complete the course on their time schedule.

### **Subchapter I – Scope and Application**

SPS 322.01 Scope. SPS 322.02 Application.

#### **Subchapter II – Definitions**

SPS 322.10 Definitions.

### **Subchapter III – Insulation Materials and Installation**

SPS 322.20 Basic requirements. SPS 322.21 Protection of insulation.

### **Subchapter IV – Dwelling Thermal Envelope**

SPS 322.30 General design requirements.

SPS 322.31 Prescriptive insulation and fenestration criteria.

SPS 322.32 Specific insulation requirements.

SPS 322.33 Slab floors.

SPS 322.34 Crawl spaces.

SPS 322.35 Thermally isolated sunrooms.

SPS 322.36 Fenestration.

SPS 322.37 Air leakage.

SPS 322.38 Vapor retarders.

SPS 322.39 Ventilation and moisture control.

### **Subchapter V – Systems**

SPS 322.40 Indoor temperatures and equipment sizing.

SPS 322.41 Temperature control.

SPS 322.42 Duct systems.

SPS 322.43 Duct and plenum sealing.

SPS 322.44 Pipe insulation.

SPS 322.45 Air conditioner and heat pump efficiencies.

SPS 322.46 Replacement furnace and boiler efficiencies.

## **Subchapter VI – Simulated Performance Alternative**

SPS 322.50 General.

SPS 322.51 Performance—based compliance.

SPS 322.52 Documentation.

SPS 322.53 Calculation procedure.

#### **Exam**

180 questions related to the reference materials are used to test the attendee on their comprehension of the materials. A 70% score will need to be attained in order to pass this course.

## **Answer Sheet(s)**

2 bubble style answer sheet(s) are included. When you are finished with the exam, you may return the answer sheets for grading to:

By Mail: Uscontractorlicense LLC

By Email: michael@uscontractorlicense.com

PO Box 268

Platteville, Wisconsin 53818 By Fax: 608-571-0096

Once we get the answer sheets back, we will graded them, enter your hours into the attendance portal and email or mail you back your certificate of completion(s). You will be responsible for renewing your license with the DSPS at www.license.wi.gov website.

Any questions, please contact us at 608.348.6688

# **Uscontractorlicense LLC**

Questions 1 to 24 (Refer to Review Materials-SPS 322.01 Scope to SPS 322.10 Definitions)

 SCOPE. This chapter applies to all construction covered by this code that use any amount of renewable energy for heat generation.

Note: Non-renewable energy sources used for heat distribution only will also require compliance with this chapter.

Note: Although the actual source of heat delivered by a heat pump is renewable, a dwelling using a heat pump is not exempt from the requirements of this chapter due to the required input of electricity to run the pump and compressor.

- a. True
- b. False
- 2. APPLICATION. This chapter allows the designer the option of using various methods to demonstrate compliance with thermal performance requirements. The designer shall identify on the plan submittal form what method or subchapter is being used, and indicate the design criteria and how it is being applied. Unless specifically exempted, all requirements of this chapter apply regardless of the method used.
  - a. True
  - b. False
- 3. DEFINITIONS. "Mass wall" means a wall of concrete block, concrete, insulated concrete forms, masonry cavity, \_\_\_\_\_\_, earth and solid timber or logs.
  - a. styrofoam composite
  - b. brick or brick veneer
  - c. brick other than brick veneer
  - d. none of the above
- 4. DEFINITIONS. "\_\_\_\_\_" means a floor slab in which an uninsulated heating element, uninsulated hydronic tubing or uninsulated hot air distribution system is in contact with the slab or placed within the slab or the subgrade.

- a. Heated slab
- b. Cooled slab
- c. Sizzling slab
- d. none of the above
- 5. DEFINITIONS. "Conditioned space" means space within the dwelling thermal envelope which is provided with heated air or surfaces to provide a heated space capable of maintaining the temperature of the space to at least \_\_\_\_\_ at design conditions.
  - a. 45°F
  - b. 50°F
  - c. 55°F
  - d. 60°F
- 6. APPLICATION. This chapter is not intended to conflict with any safety or health requirements. Where a conflict occurs, the safety and health requirements \_\_\_\_\_ govern.
  - a. may
  - b. might
  - c. shall
  - d. should
- 7. DEFINITIONS. "Infiltration" means the controlled inward and outward air leakage through cracks and interstices in any dwelling element and around windows and doors of a dwelling caused by the pressure effects of wind, and the effect of differences in the indoor and outdoor air density.
  - a. True
  - b. False
- 8. DEFINITIONS. "Opaque areas" means all exposed areas of a dwelling envelope which enclose conditioned space except openings for \_\_\_\_\_\_ and dwelling service systems.
  - a. windows
  - b. skylights
  - c. doors
  - d. windows, skylights and doors

9. DEFINITIONS. "" means the sum of areas of all floors in conditioned space in the structure, including basements, cellars, and intermediate floored levels measured from the exterior faces of exterior walls or from the center line of interior walls, excluding covered walkways, open roofed—over areas, porches, exterior terraces or steps, chimneys, roof	13. DEFINITIONS. "IC—rated" means an electrical fixture tested and listed by an independent testing laboratory as being for installation in a cavity where the fixture may be in direct contact with thermal insulation or combustible materials.
overhangs and similar features.	a. unfitting
	b. unacceptable
a. opaque areas	c. suitable
b. Conditioned space	d. improper
c. Conditioned floor area	
d. none the above	14. DEFINITIONS. "Crawl space wall" means the opaque portion of a wall which encloses a crawl space and is partially
10. DEFINITIONS. "HVAC system" means the equipment, distribution network, and terminals that provide either	or totally below grade.
collectively or individually the processes of heating, ventilating,	a. True
or air conditioning to a building.	b. False
a. True	15. DEFINITIONS. "Renewable energy sources" means sources
b. False	of energy, including minerals and petroleum products, derived from incoming solar radiation, trees and other plants, wind,
11. DEFINITIONS. "Dwelling thermal envelope" means the elements of a dwelling with enclosed conditioned space through which thermal energy may be transferred to or from	waves and tides, lake or pond thermal differences and from the external heat of the earth.
unconditioned space or the exterior.	a. True
_	b. False
a. True	
b. False	16. DEFINITIONS. "Sun room" means a one—story structure
	attached to a dwelling with a glazing area in excess of
12. DEFINITIONS. "Exterior wall area" means the normal	of the gross area of the structure's exterior walls
projection of the dwelling envelope wall area bounding interior	and roof.

d. permanently fastened

Questions 59 to 73 (Refer to Review Materials – SPS 322.37 Air leakage to SPS 322.39 Ventilation and moisture control)

59. VAPOR RETARDERS. *General.* (a) *Definition.* Under this section, a vapor retarder is a material with no intrinsic thermal or structural properties that has a rating of 1.0 perm or less when tested in accordance with ASTM standard E 96, Procedure A.

- a. True
- b. False

60. AIR LEAKAGE. Window and Door Assemblies. (a) General. Except as specified in par. (b), windows, skylights and sliding glass doors shall have an air infiltration rate of 3 cfm per square foot, and swinging doors 5 cfm per square foot, when tested according to NFRC 400 or AAMA/WDMA/CSA 101/I.S.2/A440 by an accredited, independent laboratory and listed and labeled by the manufacturer.

- a. True
- b. False

61. VAPOR RETARDERS. Continuity. The vapor retarder shall be continuous. All joints in a vapor retarder consisting of sheet material shall be overlapped \_\_\_\_\_\_ and taped or sealed, except as provided in subd. 2. Rips, punctures and voids in the vapor retarder shall be patched with vapor retarder materials and taped or sealed.

- a. 2 inches
- b. 4 inches
- c. 6 inches
- d. 8 inches

**62.** AIR LEAKAGE. *Fan Housings*. Gaps between a fan housing and a ceiling or wall that could result in air leaks shall be

- a. sealed
- b. sealed or caulked
- c. gasketed
- d. gasketed, sealed or caulked

63. VAPOR RETARDERS. *Coverage*. The vapor retarder \_\_\_\_\_ cover the exposed insulation and the interior face of the framing.

- a. shall
- b. should
- c. may
- d. can

64. AIR LEAKAGE. Joint and Penetration Sealing. (a) Exterior joints, seams or penetrations in the dwelling envelope, which are sources of air leakage, shall be sealed with durable caulking materials, closed with gasketing systems, taped, or covered with water-vapor-permeable house wrap. Joints to be treated include all of the following:

- 1. Openings, cracks and joints between wall cavities and window or door frames.
- 2. Between separate wall assemblies or their sill—plates and foundations.
- 3. Between \_\_\_\_\_ and between separate wall panel assemblies, including between interior and exterior walls.
- 4. Penetrations of utility services through walls, floor and roof assemblies, and penetrations through top and bottom wall plates.
  - a. walls, roofs
  - b. ceilings or attic ceiling seals
  - c. walls, roofs, ceilings or attic ceiling seals
  - d. none of the above

65. AIR LEAKAGE. *Recessed Lighting*. When installed in the dwelling envelope, recessed lighting fixtures shall be sealed to limit air leakage between conditioned and unconditioned spaces by one of the following means:

- (a) The fixture shall be IC—rated and labeled with enclosures that are sealed or gasketed to prevent air leakage to the ceiling cavity or unconditioned space.
- (b) The fixture shall be IC—rated and labeled as meeting ASTM E 283 when tested at 1.57 psi pressure differential with no more than 2.0 cfm of air movement from the conditioned space to the ceiling cavity.
- (c) 1. The fixture shall be located inside an airtight sealed box with clearances of at least 0.5 inch from combustible material and \_\_\_\_\_ from insulation.

b. 3 inches	Ventilation. Outdoor air intakes and exhausts shall have
c. 4 inches	automatic or gravity dampers that close when the ventilation
d. 5 inches	system is not operating.
66. VAPOR RETARDERS. Concrete or masonry basement	a. True
walls. A non-rigid sheet vapor retarder with a perm rating of	b. False
0.1 or less is in all of the following locations:	
(a) On a concrete or masonry wall which is below grade to any extent.	70. VENTILATION AND MOISTURE CONTROL. Vented Attics. (a) 1. Except as allowed under subd. 6., where air—permeable ceiling or attic insulation is installed in a horizontal position,
(b) On an insulated frame wall constructed in front of a concrete or masonry wall which is below grade to any	ventilation shall be provided above the insulation in accordance with this paragraph.
extent.	4 of the net free ventilating area is provided
<ul><li>a. allowed</li><li>b. permitted</li><li>c. prohibited</li></ul>	at the high sides of the roof, the total net free ventilating area shall be a minimum of 1/300 of the horizontal area of the ceiling.
d. none of the above	a. If more than 60%, but less than 75%
	b. If more than 50%, but less than 65%
67. VAPOR RETARDERS. Concrete floors. (a) Except as allowed	c. If more than 50%, but less than 75%
under par. (d), a vapor retarder shall be installed directly under the concrete floor slab or under the base course of concrete	d. If more than 60%, but less than 65%
floor slabs.	71. VENTILATION AND MOISTURE CONTROL. Cathedral
(b) Vapor retarder material shall be at least in thickness or shall be a reinforced material.	Ceilings. Air—permeable insulation in a cathedral ceiling assembly fill the entire cavity space unless an air
	barrier separates the top of the insulation from the
a. 4 mils	ventilation space.
b. 6 mils	
c. 8 miles	a. should
d. 9 mils	b. shall
	c. may
68. VENTILATION AND MOISTURE CONTROL. Vented Attics.	d. might
(a) 1. Except as allowed under subd. 6., where air—permeable	
ceiling or attic insulation is installed in a horizontal position,	72. VENTILATION AND MOISTURE CONTROL. Conditioned
ventilation shall be provided above the insulation in	Attics. Attic spaces are required to be vented where
accordance with this paragraph.	air—impermeable insulation is attached directly to the
<ol><li>2 of the net free ventilating area shall be distributed at the high sides of the roof.</li></ol>	underside of the roof deck and one of the following conditions are met:
a. No more than 40%	(a) Interior vapor retarders are installed between the living space and the conditioned attic.
b. At least 40%	(b) The temperature in the attic space is maintained low
c. No more than 50%	enough to prevent any moisture condensation on the insulation.
d. At least 50%	

69. VENTILATION AND MOISTURE CONTROL. Mechanical

a. 2 inches

- a. True
- b. False

73. VENTILATION AND MOISTURE CONTROL. Vented Attics. If \_\_\_\_\_\_ of the net free ventilating area is provided at the upper sides of the roof, the total net free ventilating area shall be at least 1/150 of the horizontal area of the ceiling.

- a. 55% or more
- b. 65% or more
- c. 75% or more
- d. None of the above

Questions 74 to 78 (Refer to Review Materials –
Subchapter V – Systems. SPS 322.40 Indoor
temperatures and equipment sizing to SPS 322.43 Duct
and plenum sealing)

74. TEMPERATURE CONTROL. *Mercury Thermostats*. The installation of thermostats containing mercury is \_\_\_\_\_.

Note: This section does not require the replacement of existing mercury—containing thermostats.

- a. allowed
- b. permitted
- c. prohibited
- d. none of the above

75. DUCT SYSTEMS. (1) Supply and return heating ducts, or portions thereof, that are not located completely within the thermal envelope, shall be provided with insulation with a thermal resistance of at least \_\_\_\_\_\_.

- a. R-6
- b. R-8
- c. R-10
- d. R-12

76. INDOOR TEMPERATURES AND EQUIPMENT SIZING. Indoor design temperatures. Unheated, non—habitable basement areas shall use a heating design temperature of less than \_\_\_\_\_\_. All other areas of a dwelling shall use a heating design temperature of 70°F.

- a. 65°F
- b. 60°F
- c. 55°F
- d. 50°F

77. DUCT AND PLENUM SEALING. (1) Duct systems with joints not located entirely within the conditioned space or with joints located on the unconditioned side of stud bays, joist cavities and similar spaces, shall be sealed in accordance with this section.

- a. True
- b. False

78. DUCT AND PLENUM SEALING. Tapes with rubber—based adhesives may not be used.

Note: Standard duct tape or "duck tape" has a rubber—based adhesive and does not comply with the requirements of this section.

- a. True
- b. False

Questions 79 to 83 (Refer to Review Materials – SPS 322.44 Pipe insulation to SPS 332.49 Lighting Equipment)

79. PIPE INSULATION. Heating pipes in unheated spaces shall be insulated with material providing a minimum thermal resistance of R-4 as measured on a flat surface in accordance with ASTM standard C 335 at a mean temperature of

- a. 65°F
- b. 70°F
- c. 75°F
- d. 80°F

80. AIR CONDITIONER AND HEAT PUMP EFFICIENCIES.  Heating and cooling equipment meet the minimum efficiency requirements in Table 322.45 when tested and rated in accordance with the applicable test procedure.	Questions 84 to 87 (Refer to Review Materials Subchapter VI Simulated Performance Alternative. SPS 322.50 General to SPS 322.53 Calculation procedures)
a. shall b. should c. may d. might  81. AIR CONDITIONER AND HEAT PUMP EFFICIENCIES. Where components, such as indoor or outdoor coils, from different manufacturers are used, shall be furnished by the designer that demonstrate that the combined efficiency of the specified components meets the requirements under this section.	<ul> <li>84. DOCUMENTATION. Compliance report. Compliance software tools shall generate a report that documents that the proposed design has energy costs less than or equal to the annual energy costs of the standard reference design. The compliance documentation shall include all of the following information: <ul> <li>(a) Address of the dwelling.</li> <li>(b) 1. An inspection checklist documenting the building component characteristics of the proposed design as listed in Table 322.53–1.</li> </ul> </li> </ul>
a. calculations b. guesstimations c. estimates	<ul><li>a. quarterly</li><li>b. semi-annual</li><li>c. annual</li><li>d. none of the above</li></ul>
d. calculations and supporting data  82. REPLACEMENT FURNACE AND BOILER EFFICIENCIES. A replacement furnace in existing construction may meet only the prevailing federal efficiency standard provided the duct distribution system is sealed and tested at 0.02 inches water gage across the entire system, including the manufacturer's air handler enclosure, to have air leakage less than of the furnace manufacturer's rated air flow across the blower at	85. PERFORMANCE-BASED COMPLIANCE. Compliance based on simulated energy performance requires that a proposed dwelling be shown to have an annual energy cost that is less than or equal to the annual energy cost of the standard reference design.  a. True b. False
high speed.	
<ul><li>a. 10 percent</li><li>b. 15 percent</li><li>c. 20 percent</li><li>d. 25 percent</li></ul>	86. CALCULATION PROCEDURE. <i>General</i> . Except as specifically allowed under this section, the standard reference design and proposed design does not need to be configured and analyzed using identical methods and techniques.
83. LIGHTING EQUIPMENT. A minimum of 50 percent of the lamps in permanently installed lighting fixtures shall be high—efficacy lamps.	a. True b. False

a. Trueb. False

87. CALCULATION PROCEDURE. <i>Calculation software tools.</i> Calculation procedures used to comply with this section shall be capable of calculating the annual energy consumption of all building elements that differ between the standard reference	90. SOME ENERGY BASICS. Chapter SPS 322 requirements can be put into the four categories of with some overlap between the four.
design and the proposed design and shall include the following capabilities:  (c) Calculations that account for the effects of and part—load ratios on the performance of heating, ventilating and air conditioning equipment based on climate and equipment sizing.	<ul> <li>a. heat loss control, radiation, ventilation design and moisture control</li> <li>b. 	a. Unrestrained
	b. Unresponsive
	c. Underground
	d. Unusual
	u. Ullusual

105. HEAT LOSS BY CONDUCTION. Heat Loss Calculations. To find the heat loss per hour through a building section of wall, you: - determine its U-value by finding the inverse of the sum of individual R-values for each layer of material; - decide on the inside and outside temperatures (in the case of the UDC, the winter design temperatures are mandated- see SPS 322.40(c) and the UDC Appendix A 323.02(1)); - measure the surface area of the building section; - multiply these numbers together and get a result in BTUs per hour.
a. True b. False  106. HEAT LOSS BY CONDUCTION. <i>U-Overall</i> . One more term to know is U-overall or U <sub>0</sub> which refers to the overall U-value of a building component such as a wall or ceiling.
a. True b. False
107. HEAT LOSS BY CONVECTION. The other mechanism of heat loss addressed by the UDC is convection, or heat loss by air movement. In homes, this is principally heat loss by  a. infiltration b. exfiltration c. infiltration and exfiltration d. none of the above  108. HEAT LOSS BY CONDUCTION. U-Overall. The U-overall value is calculated by taking the weighted average of the U-values and R-values of the different parallel paths through the different component (wall,

a. Trueb. False

109. HEAT LOSS BY CONVECTION is the loss of heated air through building cracks and other openings.	113. HEAT LOSS BY CONVECTION. The volume exchanged can be determined by measuring or judging how many air changes that a house goes through in an hour. To do
<ul><li>a. infiltration</li><li>b. Exfiltration</li><li>c. infiltration and exfiltration</li><li>d. none of the above</li></ul>	this, you calculate the volume of the heated space and multiply by an air change rate. For a UDC home, you can assume a rate between 0.2 and 0.5 air changes per hour [see SPS 322.30(2)], usually with a lower rate for basements with little outside air exposure, and higher rates for living areas or exposed basements. If you have a
110. HEAT LOSS BY CONDUCTION. System Design. As an alternative, the system design method can be used so that more insulation is put in the ceiling to make up for the extra windows. However, it is not a one-for-one	1500 square foot house on a crawl space with 8-foot ceilings, the calculation of the volume exchanged can be: 1500 sq. ft. x 8 ft. x 0.5 Air Changes/hr = 6,000 cu. ft./hr
tradeoff because of the thermal transfer properties and mathematics of reciprocals involved. Let's say you have an R-10 ( $U = 0.1$ ) wall and R-10 ( $U = 0.1$ ) ceiling of equal	a. True b. False
area. If you transfer half of the wall insulation, to the ceiling, the wall becomes R-5 ( $U=0.2$ ) and the ceiling becomes R-15 ( $U=0.07$ ). However, you can see that the wall U-value increased by 0.1 and the ceiling U-value	114. HEAT LOSS BY CONVECTION. Another method of determining heat loss by convection is the method.
only decreased by 0.03. (Remember U-values are used to	a. crevice
calculate heat losses.)	b. cranny
	c. crack
a. True	d. cut
b. False	
	115. TOTAL DWELLING HEAT LOSS. If you add the heat
111. HEAT LOSS BY CONVECTION is the	losses by conduction and convection, you arrive at the
introduction of outside cold air into the building.	total dwelling heat loss for purposes of the UDC. Of
<ul><li>a. Infiltration</li><li>b. Exfiltration</li><li>c. infiltration and exfiltration</li><li>d. none of the above</li></ul>	course this figure is approximate and ignores other means of heat loss. However, it also ignores the major heat gain from secondary sources such as etc. So the figure tends to overstate the heat loss but this ensures an adequately sized heating plant.
112. HEAT LOSS BY CONVECTION. Air pressure differences are caused by wind pressures and the "stack" effect of warm inside air that tends to rise. Mechanically induced air pressure differences can also occur due to such	<ul><li>a. electric lights</li><li>b. human bodies</li><li>c. cooking</li><li>d. electric lights, human bodies, cooking</li></ul>

- a. secondarily
- b. principally
- c. unexceptionally
- d. none of the above

things as exhaust fans and furnace venting.

116. HEAT LOSS BY CONVECTION. For this method (crack)	
you obtain the air leakage rates in cubic feet per minute	!
for the doors and windows from their manufacturers and	d
multiply by the lineal feet of sash crack or square feet of	i
door area. (A more exact analysis would multiply the do	or
infiltration rates by 1 or 2 due to open/close cycles and	
add 0.07 cfm per lineal feet of foundation sill crack.) Thi	S
gives an air change rate per minute. This has to be	
converted to an hourly rate by multiplying by	
Then you substitute this figure for the air change rate in	
the infiltration heat loss equation above.	

- a. 40
- b. 50
- c. 60
- d. 70

117. MOISTURE CONTROL. There are \_\_\_\_\_ methods of reducing the possibility of condensation--vapor retarders and cold-side venting.

- a. two
- b. three
- c. four
- d. unlimited

118. MOISTURE CONTROL. Vapor Retarders and Air Barriers. A perm is at least two grains of water per (30 minutes) (square foot) (inch of mercury vapor). The higher the number, the more resistant is the material to moisture flowing through it.

- a. True
- h False

119. MOISTURE CONTROL. The second area of concern addressed by the UDC is control of moisture. The occupancy of a dwelling produces a large amount of water vapor. As you may recall from weather forecasts, warmer air can hold more moisture than cold air. In the winter, the inside air is warmer than the outside, so if moisture moving outside by convection or dispersion (similar to conduction) reaches too cold of air, it will "condense out." This occurs at the dew point for that water vapor/air mixture. This condensation can be damaging to the

building if it happens inside part of the wall or ceiling construction. It can promote structural member decay and lessening of the insulation's effective \_\_\_\_\_\_.

- a. k-value
- b. C-value
- c. R-value
- d. none of the above

120. MOISTURE CONTROL. Vapor Retarders and Air Barriers. The temperature \_\_\_\_\_\_\_ is generally cooler due to the fact that it is difficult to insulate at this location due to the method of construction. The insulation may be further reduced due to the roof system allowing less insulation to be placed above the corner.

- a. in the curve
- b. at the corners
- c. none of the above

121. MOISTURE CONTROL. Vapor Retarders and Air Barriers. The required continuity of the vapor retarder over the warm-in-Winter surface provides the required barrier to bulk movement of moist air through the assembly. This means the retarder also needs to be continuous with seams and holes lapped or sealed.

- a. True
- b. False

122. MOISTURE CONTROL. Vapor Retarders and Air Barriers. A vapor retarder (sometimes called a vapor barrier) acts to slow down the movement of moisture through a section of the building envelope by water vapor diffusion and bulk movement of moist air. A vapor retarder's efficiency at improving moisture movement by water vaper diffusion is measured by its permeability in "berms."

- a. True
- b. False

123. MOISTURE CONTROL. Vapor Retarders and Air	a. True
Barriers. Vapor condenses when it comes in contact with	b. False
material that is at a temperature lower than its dew point.	b. Tuise
This temperature typically occurs within the wall cavity and thus would condense out water vapor before it can escape from the dwelling. This moisture can cause decay of building materials and a reduction in insulating value.	128. MOISTURE CONTROL. <i>Impervious Insulation</i> . Use of closed-cell foam plastic insulation or similar non-absorbent insulating materials that are unaffected by moisture condensation is another effective method used
a. True	for some designs of dwellings to deal with this issue.
b. False	a. True

	d. none of the above		
	u. Holle of the above		

138. MOISTURE CONTROL. How can you determine if a	)
home has a moisture problem? Staining and mold or	n
window frames.	

- a. True
- b. False

139. MOISTURE CONTROL. How can you determine if a home has a moisture problem? Mold or water spots in numerous locations on the inside surface of outside walls. Common trouble spots include \_\_\_\_\_ or other areas where air circulation is limited.

- a. closets on outside walls
- b. corners between two outside walls or between an outside wall and ceiling
- c. outside walls behind furniture
- d. closets on outside walls, outside walls behind furniture, corners between two outside walls or between an outside wall and ceiling

140. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems?

Other ways you can reduce moisture generation:

- Vent clothes dryers outdoors;
- Don't line dry clothes indoors;
- Limit the number of houseplants;
- Cover kettles when cooking;
- Limit the length of showers; and
- Do not operate a humidifier in the wintertime unless your indoor relative humidity is below
- Be sure any crawlspace floors have a vapor retarder covering.
- a. 25 percent
- b. 30 percent
- c. 35 percent
- d. 40 percent

141. MOISTURE CONTRO	L. Besides the UDC requirements,
what measures can help	prevent moisture problems? One
way to substantially red	uce the chances that condensation
will occur either on	is to keep indoor moisture
levels low. The first step	is to reduce the amount of
moisture produced in the	ne home.

- a. inside surfaces
- b. within walls
- c. inside surfaces or within walls
- d. none of the above

142. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems? Prevent moisture from entering through basements. Many basements feel damp in the summer due to condensation of moisture from the air on cool basement surfaces. However, in some cases damp basements may be due to \_\_\_\_\_\_ entering the home through basement walls. Cracks or stains on basement walls and floors are signs of dampness entering through these surfaces.

- a. run-off
- b. ground moisture
- c. humidity
- d. rain

143. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems? Do not store large amounts of firewood in the basement. Even seasoned wood can contain large amounts of moisture. It also may be a source of fungus.

- a. True
- b. False

144. MOISTURE CONTROL. Besides the UDC requirements,
what measures can help prevent moisture problems? Add
Mechanical Ventilation. A widely recommended
ventilation rate for homes is one half air change per
hour. In a 1,200-square-foot house with 8-foot high
ceilings, there are about 9,600 cubic feet of air. To meet
the ventilation standard, half of that amount or 4,800 cubic
feet of air must be exchanged every hour. This roughly equals
of air exchange. Even in a tight house
some of this air exchange occurs naturally.

- a. 100 cubic feet per minute (cfm)
- b. 200 cubic feet per minute (cfm)
- c. 300 cubic feet per minute (cfm)
- d. 400 cubic feet per minute (cfm)

145. RELATIVE HUMIDITY. In winter, the ideal relative humidity range for comfort is \_\_\_\_\_\_. A lower humidity may cause excessive skin evaporation which in turn will cause an undesired cooling effect. For the sake of protecting the structure from damage due to excessive moisture, an ideal relative humidity range of less than 45 percent is recommended. Therefore, to provide comfort and still protect the building, a relative humidity range between \_\_\_\_\_\_ is recommended.

- a. 35 percent 45 percent.
- b. 30 percent 45 percent.
- c. 30 percent 50 percent.
- d. 35 percent 50 percent.

146. RELATIVE HUMIDITY. In summer, the ideal comfort range is \_\_\_\_\_\_. Higher humidity won't allow adequate skin evaporation and the resulting desired cooling effect.

- a. 35 percent 45 percent.
- b. 30 percent 45 percent.
- c. 30 percent 50 percent.
- d. 35 percent 50 percent.

147. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems? Mechanical Ventilation. As the code has mandated tighter home construction, the UDC has had to provide increase of mechanical ventilation as an alternative to infiltration to maintain indoor air quality so excessive humidity or other pollutant levels are checked. This has taken the form of required exhaust ventilation for rooms with a

- a. toilet
- b. tub or shower
- c. kitchen exhaust
- d. all of the above

148. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems?

Mechanical Ventilation. A designer may decide to use an air-to-air heat exchanger to satisfy the exhaust requirement, while at the same time recovering heat from the exhausted air. This is done by moving the exhausted air past the intake air with a heat exchanging barrier between the two air streams.

- a. True
- b. False

149. MOISTURE CONTROL. Besides the UDC requirements, what measures can help prevent moisture problems? Add Mechanical Ventilation. Stop Moisture At The Inside Wall Surface (In Addition To The Required Moisture Vapor Retarder). In addition to reducing moisture levels of the interior air, carefully seal all openings in the inside surface of all exterior walls to prevent moist air penetration. This includes \_\_\_\_\_ and any other penetrations. Gaskets for electrical penetrations are now commonly available, be sure that they extend to the outside edge of the cover plate of electrical devices.

- a. joints around window and door casings, baseboards
- b. baseboards, electrical outlets and switches
- c. joints around window and door casings, baseboards, electrical outlets and switches
- d. none of the above

150. MOISTURE CONTROL. Add Mechanical Ventilation.  Negative pressure could cause exhaust gases from your furnace or water heater, which should be going up your chimney or out a vent, to be sucked into the living space.	154. DWELLING THERMAL ENVELOPE. <i>Ceilings with Attic Spaces</i> . This section permits the use ofin the attic space in lieu of R-49 specified in Table 321.23-1 as long as the insulation covers the entire attic area including over the exterior wall top plates. This could be		
a. True b. False	accomplished with the use of "energy heel" trusses. The height of the heel would depend on the type of insulation used to attain the insulation value.		
Questions 151 to 180 (Refer to Review Materials – UDC Commentary Chapter SPS 322 – Subchapter I – Scope and Application to Subchapter VI – Simulated Performance Alternative)	a. R-28 b. R-30 c. R-38 d. R-45		
151. SCOPE AND APPLICATION. As there are method, submitters of plans & calculations should clearly communicate which method of compliance is being provided for the dwelling.	155. MATERIALS AND EQUIPMENT. <i>Protection of Insulation</i> . This section now requires blanket insulation to be held in place by a covering or mechanical fastening. SPS 322.2 1(2) requires cold-in-Winter side windwash protection of air-permeable insulation, thus also keeping insulation in place and maintaining the of that insulation. Normally the exterior sheathing would do this,		
a. just one	but where that is not present, some other vapor- permeable		
b. more than one	material, such as house wrap would be required.		
c. not more than one	•		
d. none of the above	a. R-value		
	b. U-value

	b. U-factors		
153. SCOPE AND APPLICATION. Dwellings that use non-	c. T-factors		
renewable sources of energy, such as wood or solar, for heat generation, including for what is used by any heat numbs, are not exempt from the building envelope	d. S-factors		

insulation requirements.
a. True
b. False

157. DWELLING THERMAL ENVELOPE. Envelope Compliance. Envelope compliance may be by prescriptive method of SPS 322.31(1) by either complying with Table 322.31-1 or Table 322.31-4 or alternatively, per SPS 322.3 1(2) by showing the overall envelope U-value multiplied by Area complies. The latter method may be done by hand calculation or more typically by the use of the free software program, Rescheck, available from the federal government at <a href="https://www.energycodes.gov">www.energycodes.gov</a>.

- a. True
- b. False

158. DWELLING THERMAL ENVELOPE. Sun Rooms vs. Screen Porch. This option for increased insulation levels is available to heated sunrooms with opaque walls and glazing as well as heated screen rooms with only screens for a portion of the walls.

- a. True
- b. False

159. DWELLING THERMAL ENVELOPE. Fenestration. Different types of window operating hardware will produce different U-values for similar-sized windows. Therefore, a 3'-0" x 3'-0" double hung window would have a different U-value from a 3'-0" x 3'-0" fixed window sash. Similar size windows produced by two different manufacturers would most likely also have \_\_\_\_\_\_ U-values. Averaging of U-values is by area-weighting per SPS 322.36(1).

- a. similar
- b. the same
- c. identical
- d. different

160. DWELLING THERMAL ENVELOPE. Crawl Spaces. This section requires a vapor retarder on the floor of a crawl space. Per Table 332.37, it shall be a Class I vapor retarder, which is defined by the IBC as having a perm rating of 0.1 or less. Note that requirement to run the vapor retarder \_\_\_\_\_\_ wall is applicable when there is no floor present to maintain the vapor retarder in place.

- a. 4" up the foundation
- b. 5" up the foundation
- c. 6" up the foundation
- d. up to the

#### 161. DWELLING THERMAL ENVELOPE. Slab Floors.

less than 12" below grade must meet Table 322.31-1 or 322.31-4 for Unheated Slab R-value with perimeter insulation. Heated slabs of any depth with embedded, uninsulated heating ducts or pipes require slab insulation throughout, with additional insulation at the perimeter.

- a. Unheated slabs
- b. Shallow slabs
- c. Horizontal slabs
- d. Heated slabs

162. DWELLING THERMAL ENVELOPE. Air Leakage. Air leakage at fenestration and at other penetrations in the envelope are to be sealed properly per SPS 322.37(3), (4) & (6)(b) requirements or pass a blower door test per (6)(a). SPS 322.37(4) provides specific guidance on recessed lighting installed at envelope areas, without leading to overheating fires.

- a. True
- b. False

#### 163. DWELLING THERMAL ENVELOPE. Slab Floors.

\_\_\_\_\_\_ insulation that projects away from the building shall be protected by either pavement or a minimum of 10 inches of soil. See UDC Appendix drawings showing acceptable and unacceptable perimeter insulation in terms of ensuring the edge of the slab is properly insulated.

- a. Unheated slab
- b. Shallow slab
- c. Horizontal slab
- d. Heated slab

164. DWELLING THERMAL ENVELOPE. *Air Infiltration Barrier*. The UDC does not define materials to be used as an infiltration barrier. It does require them to:

- Be installed on the interior face, typically as part of the vapor retarder, or on the exterior face of the wall, typically as a house wrap or caulked building panels.
- 2. Form a continuous barrier over the walls of the building from the bearing points of the roof to the top of the foundation.
- 3. Have all \_\_\_\_\_ sealed.
  - a. joints and tears
  - b. seams and punctures
  - c. joints, seams and tears
  - d. seams, joints, tears and punctures

165. DWELLING THERMAL ENVELOPE. *Fenestration*. Fenestration is an architectural term for

- a. windows and doors
- b. doors and patios
- c. windows and patios
- d. none of the above

166. DWELLING THERMAL ENVELOPE. Paint as a Vapor Retarder. The following is the recommended procedure to be followed by building inspection agencies to assure compliance with the vapor retarder requirement:

3. At the time the insulation/rough energy inspection is made, the inspector will be able to determine where the standard vapor retarder was applied in the dwelling.

- a. True
- b. False

167. DWELLING THERMAL ENVELOPE. Paint as a Vapor Retarder. Certain paints have been tested per ASTM E-96 to provide a vapor retarder with a \_\_\_\_\_\_ or labeled as Class II (Class I would also be acceptable) when applied at specified rates and coats for certain surfaces.

- a. perm of 1 or lower
- b. perm of 2 or lower
- c. perm of 3 or lower
- d. perm of 4 or lower

168. DWELLING THERMAL ENVELOPE. Paint as a Vapor Retarder. In order to assure building officials and owners that vapor retarder paint has in fact been installed and the intent of SPS 322.38 met, a certificate of compliance may be filled out and submitted to the Building official with a copy to the owner.

- a. True
- b. False

169. DWELLING THERMAL ENVELOPE. Vapor Retarder Continuity. Vapor retarder continuity is important for purposes of preventing bulk movement of warm, moist air into building assemblies, which is a more significant source of moisture than diffusion through the vapor retarder.

- a. True
- b. False

170. DWELLING THERMAL ENVELOPE. Vapor Retarders Not on In-Winter Warm Side. Occasionally it occurs that a wall will have two materials or layers that may act as vapor retarders. It is important in this situation that the better vapor retarder (lower perm rating) be placed closer to the warm side. Also, extreme care \_\_\_\_\_\_\_\_ to make the interior vapor retarder continuous with good joint and penetration sealing. This will help avoid condensation of moisture in the wall.

- a. shall be taken
- b. may be taken
- c. can be taken
- d. should be taken

1/1. DWELLING THERMAL ENVELOPE. Vapor Retarders
Prohibited on Concrete or Masonry Walls. The code prohibits
installing a non-rigid vapor retarder of a, such as
roll polyethylene sheeting ("Visqueen"), on or in front of
masonry or concrete below grade foundation walls. This is
avoiding the potential for moisture from adjoining earth
being trapped between an interior vapor retarder and the
wall and possibly causing degradation and mold.

- a. perm rating appropriate for the wall
- b. 0.1 perm or more rating
- c. 0.1 perm or less rating
- d. none of the above

172. DWELLING THERMAL ENVELOPE. Exceptions to Vapor Retarder. If the exceptions in this section to a continuous vapor retarder at boxsills or over spray-applied foam are used, you are also required to stop air leakage at those locations that would have been otherwise provided by a continuous vapor retarder.

- a. True
- b. False

173. SYSTEMS. Ducts in Unconditioned Spaces. Ducts located outside conditioned space, including those in \_\_\_\_\_\_ shall be insulated to at least R-8. Per SPS 322.10(3), conditioned is defined as being heated to 50 degrees or more at design conditions.

- a. attics and unheated garages
- b. vented crawl spaces and under slabs
- c. attics, unheated garages, and vented crawl spaces and under slabs,
- d. none of the above

174. SYSTEMS. Duct Sealing and Testing. Any part of the supply and return duct system that is outside the conditioned space, including those in unconditioned attics, unheated garages, insulated floors, exterior stud spaces and vented crawl spaces and under slabs, \_\_\_\_\_\_ per this section. Additionally, the whole duct system, including the air handler and both supply and return ducts, shall be tested for air tightness at either the rough-in or post-construction testing.

- a. can be tested
- b. shall be tested
- c. shall be sealed
- d. can be sealed

175. SYSTEMS. <i>Pipe Insulation</i> . Subsection (1) requires	
hydronic heating pipes in all areas to have at least	
and subsection (3) requires hydronic spa	ces
in unheated spaces to have at least	
Generally basements are not considered unheated sp	aces,
even without radiators installed.	

- a. R-3 insulation/ R-3 insulation
- b. R-4 insulation/ R-4 insulation
- c. R-4 insulation/ R-5 insulation
- d. R-3 insulation / R-4 insulation

176. SYSTEMS. Duct Sealing and Testing. Duct tightness, especially relative to the outdoors, is important in that any air lost to the outdoors causes negative dwelling pressure as the result of the air handler drawing in outside air to replace the leaked duct air. Negative dwelling pressure potentially causes backdrafting of any open combustion appliances and infiltration of unconditioned air into the dwelling

- a. True
- b. False

177. SYSTEMS. Replacement Furnace & Boiler Efficiencies.
Alternatively, the replacement equipment is required to comply with the less stringent Wisconsin heating equipment efficiency requirements of Table 322.31-3 (as for new construction that is permitted reduced thermal envelope insulation levels) without duct sealing or circulating motor limits.

- a. True
- b. False

178. SYSTEMS. *Pipe Insulation*. The requirement for insulating circulating service hot water piping is applicable to systems mechanically circulated with pumps, not to thermosiphon systems that use convection to circulate the water.

a. True

b. False

179. SYSTEMS. Replacement Furnace & Boiler Efficiencies.

Normally replacement equipment may meet the code at the time of their original installation per s. SPS 320.07(61) definition of repair, as opposed to alterations that need to meet the current code. (Note that the federal government has evolving minimum heating appliance efficiencies that apply to all residential installations, new or replacement.)

However, this section requires that replacement furnaces also comply with specified duct sealing criteria and that replacement boilers comply with circulating motor limits.

a. True

b. False

#### 180. SIMULATED PERFORMANCE ALTERNATIVE.

Documentation of Simulated Performance Alternative.

Acceptance of SPS 322.52 is typically required by
REMrate software that models the whole house energy
usage. REM/Rate software is proprietary to certain
providers. The version 12.6.2.1 or earlier is required to
show compliance with the current code.

a. True

b. False
